Is this a "Fast & Focused" Search Request? (Circle One) ☒ YES ☐ NO

A "Fast & Focused" Search is completed in 2-3 hours (maximum). The search must be on a very specific topic and meet certain criteria. The criteria are posted in EIC2100 and on the EIC2100 NPL Web Page at <http://ptoweb/patents/stic/stic-tc2100.htm>.

What is the topic, novelty, motivation, utility, or other specific details defining the desired focus of this search? Please include the concepts, synonyms, keywords, acronyms, definitions, strategies, and anything else that helps to describe the topic. Please attach a copy of the abstract, background, brief summary, pertinent claims and any citations of relevant art you have found.

Class 709

Automatic Workload Configuration

Yiping Ding

Kenneth Newman

Filing Date: 12/08/2000 - Earliest Priority

Invention: Recording a log of transactions/processes/network activities where the log has a record of time stamps/periods of time for the transactions and ~~resources~~ computer/network resources for that same period then calculating a similarity factor / ~~correlation~~ correlation coefficient to determine/verify what transactions used what system/network ~~computer~~ resources

Base words: workload characterization, correlation, workload grouping, resource log, process log, transaction log,

Abstract (Basic): US 20020116441 A1

NOVELTY - A log of transactions comprising timestamp and a log
of resource usage comprising several timestamps and system
performance metrics which reflect resource consumption, are generated
in a computer. The timestamps in transaction log are compared with
the timestamp in resource log, based on which the transactions
using specific resources are determined.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are included for the
following:

(1) Carrier medium storing automatic workload characterization
program; and

(2) Automatic workload characterization system.

USE - For characterizing automatic workload for e-commerce,
e-business, etc.

ADVANTAGE - Enables determining with much greater precision, that
which resources are used by which workloads. Allows workloads to be
constructed automatically, without the need of significant assistance
or intervention by a user assistance.

DESCRIPTION OF DRAWING(S) - The figure shows the flowchart
explaining the automatic workload characterization method.

Transaction management system for e.g. network computing environment -
has preliminary treatment advance unit that starts updating decision
preliminary treatment when preparation indication is transmitted from
another resource manager

Patent Assignee: TOSHIBA KK (TOKE)
Number of Countries: 001 Number of Patents: 001
Patent Family:

Patent No	Kind	Date	Applicat No	Kind	Date	Week
JP 10228405	A	19980825	JP 97241323	A	19970905	199844 B

Priority Applications (No Type Date): JP 96328620 A 19961209

Patent Details:

Patent No	Kind	Lan	Pg	Main IPC	Filing Notes
JP 10228405	A		14	G06F-012/00	

Abstract (Basic): JP 10228405 A

The system has a **transaction monitor** (11) that transmits an updating decision preparation indication to resource managers (21a), when an application process requires a **transaction** commitment. A preparation indication notifying unit enables each resource manager to transmit a preparation indication notification to **all other resource managers**, when the updating decision preparation indication is transmitted from the **transaction monitor**.

A preliminary treatment advance unit starts an updating decision preliminary treatment when the preparation indication notification is transmitted from another resource manager and the updating decision preliminary treatment is not yet started. Preferably, the resource managers are **connected** by a second network. The data transfer rate of the second network is faster than the first network which **connects** the **transaction monitor** to the **resource managers**.

ADVANTAGE - Shortens **transaction** decision time since frequency of communication with **transaction monitor** and **resource manager** is reduced. Shortens **transaction** nullification time since recovery process is started in advance.

Abstract (Basic): AU 9351904 A

The system has system management facility file (SMFF) which contains status of utilisation of each of the resources constituting a computer system, recorded at regular intervals as a system resource utilisation record. The execution hysteresis of each of the jobs executed on the computer system is recorded at regular intervals as job activity record. A system configuration file holds information on connective relationships between an external memory unit and an external memory control unit to control the external memory unit and information on names of files stored in it as system configuration data.

The system management facility record input program (SMFRIP) inputs each record in SMFF and resource utilisation ratio threshold value file (RURTVF) stores the alarm and limit values within performance guarantee, for utilisation ratio (UR) of each of the resources constituting the computer system as threshold values of the resource utilisation ratio (RUR). Further, a heavily loaded resource selection program compares information on RURs in the system resource utilisation record entered by SMFRIP with limit value of utilisation ratio threshold values (URTV) in this RURTVF, and extracting the resource name, recorded time and RUR in the system RUR indicating a heavily loaded status.

USE/ADVANTAGE - To determine loading status of resources constituting a computer system, identifying name of job or resource and presenting to user a result of performance evaluation readily and reliably, even if not versed in performance evaluation procedures.

Abstract (Basic): EP 443971 A

The method efficiently maintains a record of activities relating to a selected resource object managed by a resource manager and accessible by a users within the data processing system. A history log having a finite storage capacity (74) is created. The history log is associated with a selected resource object. The method records within the history log those activities relating to the said selected resource object (76,78).

In indication (82) of the nonrecordability of an activity relating to the selected resource object is generated in the event the recordation of the said activity shall exceed the said storage capacity.

ADVANTAGE - Maintains multiple resource objects. (9pp Dwg.No.1/3

Abstract (Basic): US 20020128803 A1

NOVELTY - A data collector monitors certain portions of the user's
activity . A data analyzer determines which portions of the user's
activity constitutes a continuous predefined activity . A timer
stores an actual time when the user is engaged in a specified task, and
stops storing upon expiration of an idle time limit.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are included for the
following:

- (1) Computer use monitoring method;
- (2) User- activity monitoring method; and
- (3) Method for automatically collecting and analyzing information

about time and **activity** performed on computer.

USE - For **monitoring** user's **activity** such as file, keystroke, mouse **activity** in remote telecommuting employment application, determining **activity** costs, estimating time and amount billable for future projects/work, measuring cost/benefit of new software/hardware, project management linking, nano-business costing, resource management tool, manufacturing systems, remote education, screening new hires, disk duplicating machines, video conferencing consultation with automatic billing calculations, publication services, etc.

ADVANTAGE - Enables automatic measurement of time and work done by operator and provides documentation tool beneficial to both management and workers. Avoids collection of voluminous and meaningless **activities**. Provides automatic and accurate documentation and unaltered proof of work done on a computer. Also the amount of time and work performed out of sight can be accurately documented and encrypted to prevent manipulation of recorded data. Allows managers to feel more comfortable with having their computer-oriented employees telecommute, resulting in economic benefits to the employer, employee and ecological benefits from reduced vehicle usage and car emissions due to commuting.

DESCRIPTION OF DRAWING(S) - The figure shows a block diagram of the data collection and analysis system.

Abstract (Basic): JP 8286962 A

The system consists of a unit that accepts a transaction demand and transmits the details to a transaction monitor mechanism through a transmitting unit. The transaction monitoring mechanism carries out scheduling of the details included in the received command.

Then, a co-ordinatable transaction monitor optimizes usage limit of computer system resources assigned for the particular transaction demand.

ADVANTAGE - Raises efficiency of processing.

Abstract (Basic): EP 364222 A

A battery powered computer system (C) monitors the address bus (20) to determine when selected peripheral devices have not been accessed for a preset amount of time. After this preset time the system powers itself off and stops the system clock thus placing it in a standby mode. The system can be reawakened by pressing a standby switch.

The preset time can be altered by the user and also depends upon other factors. The timer is disabled if an AC adapter is providing the system power, and the preset time is reduced in steps relating to the amount of energy remaining in the battery. If the standby switch is pressed during system operation, then the preset time is reduced to a very small time allowing rapid, but controlled shut down of the system.

USE/ADVANTAGE - Provides uniform and controllable means of .
automatically providing shut down on inactive system while providing
protection against data .

ABSTRACT: A new realtime data mining design that takes advantage of e-marketplaces is discussed. E-marketplace is the concept of creating dynamic extended supply chain partnerships of trading networks. Electronic trading communities take advantage of the interactive features, global reach and interconnectivity of the Internet to enable a vast array of online trade services. With the rise of e-marketplaces comes the need for tactical decision support based partly on transaction data. The need for a new data mining design is brought about by the demand for faster turnaround from data collection to data mining on transactions within and among enterprises.

ABSTRACT: Applications that access gigabyte- and terabyte-sized databases require careful **capacity planning** and **performance** monitoring. Although **performance management** is meant to highlight design problems, stress testing seldom is able to mimic actual production conditions. It is possible to calculate a metric that approximates user responsiveness. Spotting unacceptable performance can be done by figuring an average transaction response time during specific time intervals. When an unacceptable performance level is found the bottleneck is uncovered by breaking down the response time into smaller service and wait time components. Methods for fine-tuning Informix Online Dynamic Server 7.1, Oracle7, and Sybase SQL Server 11 are provided, largely through instrumentation at the RDBMS and operating system level.

ABSTRACT: Current performance monitoring tools for local area networks (LAN) are useful for identifying problems, but they lack the ability to **correlate** and analyze data for such tasks as **capacity planning**. MIS managers are hesitant to migrate mission-critical applications to client/server environments because of the lack of tools for monitoring their performance. Network performance monitoring tools are being enhanced, but individual tools lack the ability to diagnose problems in large, multivendor networks, which causes many organizations to use a combination of tools. **Use of monitoring** tools by Columbia Gas System Service Corp and Citgo Petroleum Corp is described. The four categories into which the tools can be placed are network analyzers, protocol analyzers, network management stations, and network operating system add-ons. Among the packages described are Legent Corp's LANSpy, Network General's Distributed Sniffer System, Concord Communication's Trakker, Metrix's NetMetrix, and ProTools' Network Control Series.

ABSTRACT: User demand for X terminals and workstations is increasing, which means that managers must know how these new resources will affect such system elements as the network, CPUs and I/O throughput. They must also determine where bottlenecks will appear and how to resolve them. This requires site-related **capacity planning**. The first step in **capacity planning** is to have an idea of what results to expect. Digital Equipment Corp conducted a series of tests to see how X terminals and workstations affect the total system. These tests show that all four parts of the system - application, host, communications and display - can affect performance. One result indicates the significance of applications and how small changes in applications can have a big impact on resource use. Another result shows that moving an application load to a remote system can improve performance. Estimating performance and configuration needs requires knowing the impact of the real **workload**. The number of disks needs to be maximized and the I/O load balanced over all spindles to achieve best performance in a diskless environment. **Monitoring activities** of users, collecting related data and using this information with **capacity planning** tools will result in accurately anticipating computing needs.
CAPTIONS: **Capacity planning** tools. (table); Comparing performance. (chart); Network configuration for disk versus diskless tests. (chart)

ABSTRACT: Modern transaction processing (TP) systems consist of integrated basic software, including a high- **performance** data base **management** system, communication system and TP monitor. The TP monitor should provide an interprocess communication concept that hides networking details, should manage processes and should allow system managers to easily and efficiently control large networks of terminals and processors. The TP monitor ties independent components together and provides a single, integrated interface to those components. The TP monitor's main function is to coordinate transaction requests between terminals and application programs that process the requests. The TP monitor accomplishes this by imposing a certain structure on the software components of a TP system and offering support functions for each component's activities. Other aspects of TP monitors are discussed in detail.

CAPTIONS: A **model** for TP monitors. (diagram); A forms manager's compilation process. (diagram); A program implementing MM, RC and AS functions for a terminal. (program)
